**Stem Case**

- A 6 years old 60 kg boy is scheduled for adenotonsillectomy at your ambulatory surgery center. The patient has history of mild asthma for which he requires albuterol two times a month. He presents to your surgery center with cough and runny nose for few days. Mom says he has difficult time focusing in the classroom and is sleepy during the day. Mom reports a sleep study was difficult to schedule and she just wants to get the tonsils out so her boy can sleep better and focus in the school. On physical exam, he has high arching palate and mild wheezing. His vital signs are age appropriate, but he does appear anxious.

**2022 SAMBA ANNUAL MEETING • MAY 11 – 14, 2022**

2

**Preoperative Discussion Questions**

**SOCIETY FOR SAMBA ANESTHESIA**  
Outpatient • Office Based • Non-Operating Room

**www.SAMBAhq.org**

- What preoperative questions do you have for the parents? Mom is worried about his cold.
